

# Challenges of obesity in NORA

Increase  
in NORA  
procedures<sup>1</sup>

Prevalence  
of obesity<sup>2</sup>

The use of deep sedation is on the rise with an increase in non-OR anesthesia.<sup>1</sup> With a greater number of obese patients, the risk of hypoxemia due to upper airway obstruction also increases.<sup>2</sup>

Oxygen delivery devices (*masks, cannula, and nasal high flow*) do not deliver positive pressure ventilation, which aids in maintaining a patent airway and adequate oxygenation. Several studies recommend the use of nasal CPAP (nCPAP) versus oxygen delivery.<sup>3,4</sup>

## SuperNO<sub>2</sub>VA™ nasal PAP ventilation system

The SuperNO<sub>2</sub>VA nasal PAP ventilation system uses the flow from any oxygen source. It delivers both oxygen and nasal positive pressure ventilation to patients, which can maintain a patent upper airway.

This complete system allows for portability and continued use from preoperative oxygenation through postoperative care without any additional equipment.
