The leader in the fight against premature birth, March of Dimes, states that:

- $26 billion is spent caring for babies in the NICU.

Average medical costs

- $54,194 per premature baby
- $4,389 per healthy baby

93% of premature infants are diagnosed with respiratory distress syndrome (RDS) and require ventilator support.

Use the one high frequency ventilator designed for all of your neonatal patients!

- Lower hospital cost
- As little as two days on HFOV before extubation
- Decreased duration of oxygen therapy
- Decreased nCPAP duration
- Decreased chronic lung disease (CLD)
- Discharge up to 24 days earlier

"For the subgroup of 11 trials involving 1,737 infants that used high frequency piston oscillators, there was a significant reduction in CLD in the HFOV group."

The Cochrane Collaboration® 2015

Can you afford not to use the 3100A HFOV?
