The Rogers’ Twins
Inspire Bright Futures

In March 2001, my wife and I received the exciting news that we were expecting twins. However, by October, the “routine” pregnancy quickly turned stressful and desperate. My wife went into preterm labor and three days later our twin boys were delivered by emergency caesarean, born at just 30 weeks gestation, ten weeks premature.

Fortunately, their physician used 3100A High Frequency Oscillatory Ventilators (HFOV) to protect their fragile lungs from the high ventilator pressures required to support breathing and allow them to heal. Within 72 hours, their condition improved and they were extubated to Infant Flow nCPAP again. For six weeks they experienced successes and setbacks, but we brought them home on Thanksgiving Day 2001.

Now, our boys are 15-years old, honor roll students, cross country track runners and National Junior Honor Society members. Without the powerful lung protection offered by both 3100A HFOV and the Infant Flow nCPAP in those early days, we may well have faced a very different future.

The twins’ incredible journey inspired us and awoke a deep desire in me to help families through their toughest times. I returned to school, became a respiratory therapist, worked 14 years in the same NICU that cared for our boys and had the privilege to be part of the team involved with hundreds of stories like ours.

Now, I’m a 3100A HFOV and Infant Flow SiPAP specialist for CareFusion. I’ve come full circle to the source of my inspiration, working for a truly innovative company, alongside a team of professionals committed to improving patient outcomes and lives. I visit NICUs across the country helping staff use their CareFusion oscillators and nCPAP devices so families can enjoy the blessings of healthy, happy children. My family will always be grateful to CareFusion’s life-changing technology and the dedicated professionals that use them.
