Each year, ARDS affects over 190,000 patients with 74,500 deaths.\(^1\)

When should you consider HFOV?

Patients treated with high frequency oscillatory ventilation (HFOV) are half as likely to have refractory hypoxemia.\(^3\)

You should consider HFOV when: \(^4\)

- PEEP > 10
- \(\text{FiO}_2\) > 60
- Plateau pressure > 30

Using HFOV results in:

- A 29\% relative reduction in mortality in patients\(^5\)
- Decreased intra-hospital mortality in burn ARDS patients to 32\%\(^6\)
- Reduced mortality and less treatment failure\(^7\)

For more information regarding an HFOV rental or the Intervention Program, please call 800.520.4368.
